

## LEED EXISTING BUILDING ASSESSMENT

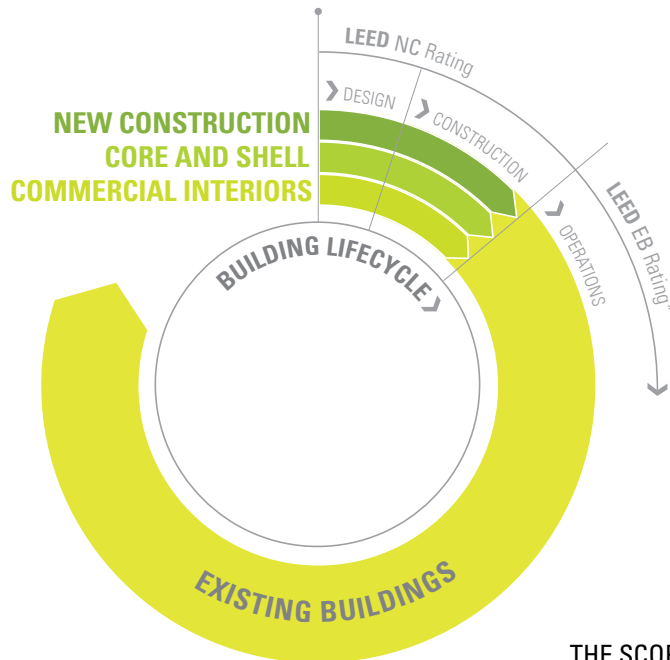

LEED is the U.S. Green Building Council’s certification program, and it’s not just for new construction anymore. To truly be green, a building must sustain ecologically responsible practices from design through construction, and throughout the building’s lifecycle in its ongoing maintenance and operations. LEED assesses a building’s performance in six major categories:

- Sustainable Sites
- Water Efficiency
- Energy & Atmosphere
- Materials & Resources
- Indoor Environmental Quality
- Innovation & Design

The results of ‘Going Green,’ while good for the environment, can also be very good for business. The cost savings and productivity increases documented by an ever growing number of companies are compelling. Whether you’ve already decided to shoot for LEED certification, you need more education on the benefits, or you want to produce a business-case in order to secure funding, our experienced, LEED-accredited professionals can help.

We assess your building’s current condition against LEED Existing Building (EB) criteria to help you understand how you stack up, what you need to change or upgrade in order to qualify for certification, the capital costs for certification of your building, and the total cost/benefit equation for your circumstances. We can then help you design a strategy and long-range plan for certification.

It makes Eco-nomic sense.

THE SCOPE OF LEED-EB ASSESSMENT
